THE BRIEF

Keep the investor's intention and the metric separate

North Star

First-time mutual-fund investors with an active SIP 12 months after their first one

Investor-good outcome

A contribution the person still wants is completed. An informed pause is also a valid choice.

Product decision

Investigate where a wanted recurring payment becomes an unclear or repeated repair task. Do not assume a market fall or an app defect.

Source: Groww graduation brief; project charter, 9 Nov 2026. Academic prototype; not affiliated with Groww.

The unit is a person, not a plan or a payment

N = A + I + U

Eligible people at month 12 = confirmed active + confirmed inactive + unresolved.

Product path: intended SIP → scheduled due → confirmed success or informed change → next-cycle state → month-12 person outcome.

Qualifying event

At least one successful SIP instalment in the preceding 30 days, across any of that person's SIPs.

Not the same event

Bank debit, pending order, one-time payment, failed retry or stopping one of several plans.

Potential lift

If x net eligible people become active, change = 100 × x / N percentage points. x and N are unknown.

Source: assignment NSM definition; PART2_4_CURRENT_DECISION_2026-11-09.md. N, A, I, U require Groww data.

PART 1 · DISCOVERY ENGINE

A source-linked question finder, not a churn calculator

932
review IDs retrieved

100
user-voice rows saved

9
provisional question readings

4
unscored opportunity leads

Collect → screen SIP relevance and duplicates → propose event, action and outcome → check the original → answer nine research questions.

Signals include expectations, deliberate changes, unwanted failures, checking, outside help and continuation. Routine checking frequency and cohort differences remain weak.

Each question card links sources, a rival explanation and a missing fact; one source root is not counted as several investors.

Quality boundary: bulk corpus label review and independent AI accuracy remain open. Retrieved records are not investor prevalence.

Open the nine-question engine

The same visible symptom can end three ways

Wanted payment, repeated repair

One Groww writer reports AutoPay working for months, then repeated failures, manual investing, bank and Groww contact, and an attempted new mandate.

Same-cycle recovery

Another Groww writer reports one of several SIPs debiting and manual catch-up of others. The following automatic cycle is not verified.

Informed adjustment

A writer reports a skipped month followed by a paid month. A skip is not necessarily lost intent or a lost person.

PM inference: compare intent → actual order → workaround → following due result. These self-reports do not establish first-ever-MF status or a 12-month rate.

Public accounts: reddit.com/r/MutualfundsIndia/comments/1wtfugh/; /1t2f3wm/; reddit.com/r/IndianStockMarket/comments/1hcgq2k/.

Five situations, one reversible research bet

BEHAVIORAL SITUATION	OBSERVED SIGNAL	BEST RIVAL
Automation-reliant repairer	Repeated manual repair	Bank or rail execution
Changed-obligation adjuster	Skip, then resume	Correct informed pause
Schedule interpreter	Asks what an edit changes	Current help suffices
Early-return reassessor	Concern, yet continues	No qualifying-payment gap
Externally guided starter	Friend shapes initial plan	Changed circumstance drove revision

Decision: test the repeated repair task because burden is reported and a hand-off is within Groww's influence. No evidence ranks its reach or month-12 lift above the alternatives.

PART 3 · VALIDATION

The survey informs questions; it cannot validate the cohort problem

9
survey submissions

5 / 8
eligible respondents who attempted a SIP

1
broad target-screen fit

0 / 5–6
critical-incident interviews

Needed contrast: a first-year Groww investor with an unwanted payment gap and a comparable continuer or informed chooser. Ask both what they intended, saw, did, and what happened at the next scheduled SIP.

One broad target-screen response mixed a long-term security goal with an early-profit expectation. That challenges a payment-only explanation, but does not measure how common either motive is.

No mock account is treated as an interview. Final payment status and strict cohort fit are unverified in public stories.

Source: PART2_4_CURRENT_DECISION_2026-11-09.md; PART3_PRIMARY_USER_RESEARCH_AND_PROBLEM_GATE_2026-11-08.md.

Repeated repair work is observed; the root cause is open

After an initially working SIP unexpectedly fails, a person who still wants to contribute may pay manually and contact several actors yet not know whether the following scheduled payment will work.

User value

Know which fact is confirmed, avoid an unsafe repeat payment, and carry a clear question to official support.

Business path

Better hand-off may help wanted next-cycle success; person-level month-12 effect remains unmeasured.

Rival explanations

Bank or rail execution may remain broken despite perfect information; current Groww help may already suffice.

Source: FINAL_PROBLEM_BOUNDARY_2026-11-09.md; Groww help for payment, mandate and order-processing states.

AI earns a place only if it beats a simpler guide on the same task

A · Groww help

Official status and payment pages already exist. The user must find the page that matches mixed bank and order signals.

B · Fixed receipt

The user selects known facts. Code gives a safe question and official route; no model uncertainty.

C · Continuity Map

AI proposes six anchored facts from mixed wording; code checks conflicts, then the user corrects the map.

Compare: correct known/unknown facts, correct official check, unsafe second-payment idea, effort and corrections. If B works as well, prefer B.

Source: MVP_CREATIVITY_AUDIT_2026-11-09.md; mvp/CONTINUITY_MAP_CONTRACT.md. Comparison is designed, not user-tested.

A working map, with a visible safety fallback

Intent → bank debit → Groww order → this-cycle workaround → next SIP → other SIP

Each row is anchored to supplied words or says unknown. Code checks conflicting states and produces fixed neutral questions. No account lookup or payment action.

Quality check

148 automated tests passed. One synthetic Groq Free call returned structured fields. These are engineering checks, not real-item accuracy.

Release boundary

Independent ~20-item hand labels and 3 real target-user tasks are outstanding. Public AI stays off; the fixed map works.

Try the public MVP

Prototype: sip-research-viewer.soumyasantra431.workers.dev/sip-map; build/test record, 9 Nov 2026.

Measure welfare-aligned continuation, not fewer pauses

Business and leading outcomes

NSM = A/N unique eligible people. Leading: correct status understanding / tasks; correct official check / tasks; wanted next-SIP success / wanted failed dues.

Investor and AI guardrails

Unexpected debit, duplicate-pay direction, false success, invented actor fault, advice-like output, affordability strain and wrongly discouraged pauses.

Main risk and mitigation

Explanation cannot repair an upstream failure. Keep actor fault unknown, route to official checks, and separate other-SIP and next-cycle outcomes.

Next evidence gate

Get strict-cohort contrasting incidents, independent real-item AI labels, and 3 target-user task tests. Keep or drop AI based on the same-task result.
